

PRD — Product Requirements Document

Automated Web Task Recorder and Replay Tool

1. What This Is

The product is a paid online service (SaaS) that watches you do something on a website one time, then learns to do it for you afterwards — on all kinds of websites. It turns your recorded actions into a proper REST API that you can use, share, or even sell to others.

Here's an example. Say you often search for show tickets. You'd do that search once, normally, just clicking around like you always do, while the product quietly watches. After that, it hands you a simple fill-in-the-blanks form. You type in what you're looking for — the show name, the date — press a button, and the product goes off and finds the results for you. The same idea works for booking hotels, checking flights, comparing prices, and other everyday online tasks.

The problem it solves. We all repeat the same online searches over and over, and it eats up time. The tools that can do this automatically usually need programming skills, so most people can't use them. The product lets anyone set it up just by showing it once.

2. What It Does

- Lets you set up an automatic task just by recording yourself doing it once — no coding.
 - Notices the details you'd want to change later (like the name or the date) and lets you edit them in a simple form.
 - Does the task again with your new details and shows neat, easy-to-read results — or skips the output entirely if you don't need one (for example, when automating sending an email or posting an announcement).
 - Works across all kinds of websites — show tickets, hotels, flights, and other everyday tasks.
 - Generates each automation as a proper REST API with auto-generated documentation, so developers can also plug it into their own tools.
 - Includes a built-in marketplace where users can list, license, and sell the APIs they've created to other people.
-

3. Who It's For

The main user is an ordinary person who keeps doing the same online searches and just wants the answer without the hassle. A second type of user is someone who creates useful automations and wants to earn money by selling them to others on the marketplace.

Here's what they'd want, in their own words:

- I want to show the tool how to do a task, so it can learn it.
 - I want it to tell me when it's ready to use.
 - I want to change a few details in an easy form.
 - I want to choose whether I need output back or not.
 - I want clear results when I do ask for them.
 - I want to save it and use it again later without setting it up from scratch.
 - I want to sell a useful automation I made and earn money from it.
-

4. How It Works, Step by Step

Step 1 — Record. You press "Start," do the task on the website like normal, then press "Stop." The tool quietly watches what you click and type. After stopping, it asks whether the task requires login credentials to work — you can choose to include them or leave them out.

Step 2 — Confirm and pay. The product redirects you to its website and shows a "Setting things up" screen. Before you can use the automation, it tells you the price of creating this particular API — based on what it needs to do, how complex the task is, and what resources it uses. You review the cost and confirm payment (via bKash or other supported methods) before it proceeds.

Step 3 — Get ready. After payment, the tool turns what you did into a working REST API. It figures out the bits you'll want to change later (like the search words or the date), and it automatically writes the documentation for how the API works.

Step 4 — Choose your output preference. Before you use the automation, it asks a simple question: do you want output back? If you're searching for something (shows, hotels), you'd say yes. If you're automating an action like sending an email or posting an announcement, you'd say no — just do the task, no need to report back.

Step 5 — Make your changes and run. You get a simple form with the changeable details, each clearly labelled. You type in what you want, press "Go," and the tool does the rest. If you asked for output, it shows tidy results. If not, it just confirms the task was done. Your saved automations sit in a list so you can run them again anytime.

5. Pricing Plans

The product is not free to use. Every user starts with a free tier, and can upgrade for more.

Free (Starter) — 5 API creation attempts per day. Good for trying things out.

Builder — 1,500 BDT/month — 30 API creation attempts per day. Unlimited runs on saved APIs. Priority support.

Pro — 3,500 BDT/month — Unlimited API creation attempts. Unlimited runs. Marketplace seller access with lower platform fees. Early access to new features.

Enterprise — Custom pricing — Everything in Pro, plus team accounts, dedicated support, and custom billing arrangements.

All plans are billed through bKash, with card and bank transfer options available as well.

6. The Marketplace

If a user creates a useful automation — say, one that checks hotel availability across several sites — they can list it on the built-in marketplace and earn money when other people use it.

How the seller sets it up. The seller chooses how to charge:

- Per single use (someone pays each time they run it).
- Per 100 uses (a bulk pack).
- Monthly subscription (unlimited use for a flat fee per month).

The seller sets the price. The platform takes a percentage cut from each sale, and this cut is dynamic — it changes depending on the size of the order:

- Orders under 500 BDT — the platform takes 20%.
- Orders between 500 and 2,000 BDT — the platform takes 15%.
- Orders between 2,000 and 10,000 BDT — the platform takes 10%.
- Orders above 10,000 BDT — the platform takes 7%.

This means the bigger the sale, the smaller the platform's share — which rewards sellers who build popular, high-value automations.

Payouts go to the seller's bKash account.

7. Billing and Payments

Since the product is based in Bangladesh, bKash is the primary payment method. Users pay through bKash for:

- Monthly plan subscriptions.
- One-time API creation fees (shown before the API is built).
- Marketplace purchases.

Card payments and bank transfers are also supported as alternatives. Sellers receive their marketplace earnings directly to their bKash account after the platform's cut is deducted.

8. REST API and Documentation

Every automation the product creates is structured as a proper REST API. This means:

- Each automation has its own endpoint (a web address you can send requests to).
- It accepts the changeable details as input and returns the results as structured data.
- The product automatically generates documentation for each API — what it does, what inputs it takes, what output it gives back, and how to use it.

This makes the automations usable not just through the website's form, but also by developers who want to connect them to their own apps or workflows.

9. How We'll Know It Worked

- The whole thing works from start to finish — record, pay, create, run — without the user needing to fix anything by hand.
 - When you run a saved task with different details, it gives the right results most of the time.
 - It correctly spots the details you'd want to change.
 - The output toggle works cleanly — output when you want it, no output when you don't.
 - A first-time user can get through the whole thing just by reading what's on the screen.
 - Marketplace sellers can list, price, and receive payments for their APIs.
-

10. Ideas for Later

Down the line, the product could run tasks automatically on a schedule (like every morning) and message you the results, let teams collaborate on building automations, add ratings and reviews to the marketplace, and expand payment options beyond bKash as it grows.

11. Conclusion

The product takes something we all find tedious — repeating the same online tasks — and turns it into a simple, paid service that anyone can use. Record a task once, get a reusable REST API, and optionally sell it to others on a built-in marketplace. With bKash-first billing, dynamic platform fees that reward bigger sellers, and auto-generated documentation, it's designed to work for everyday users in Bangladesh and beyond. It's a realistic, buildable idea with a clear path to earning revenue from day one.

End of document.
